## Análisis y Preguntas Teóricas

- ¿En qué consiste la entropía en general y la entropía en imágenes a color y en escala de grises?

La entropía mide la cantidad de información o incertidumbre en una imagen. En imágenes a color se consideran las tres bandas (R, G, B), por lo que generalmente tienen una entropía mayor. En escala de grises se reduce a una sola banda, por lo tanto la entropía suele ser menor.

- ¿En el diagrama de cajas y bigotes, qué se observa respecto al nivel de entropía?

Se observa que las imágenes a color tienden a tener mayor entropía promedio que las imágenes en escala de grises. Además, hay una mayor variabilidad en algunas categorías.

- ¿Para qué clase o categoría de imágenes se tiene un mayor nivel de entropía?

Dependiendo del conjunto, generalmente las imágenes de perros tienen mayor entropía por su variabilidad en formas, texturas y colores, en comparación con los gatos.

- ¿Cómo cambian los niveles de entropía con las modificaciones?

Las modificaciones pequeñas tienen un impacto leve en la entropía. Cambios medianos y grandes como añadir ruido o distorsiones aumentan la entropía significativamente, ya que introducen más información o desorden en la imagen.
